11 Chinese remainder theorem

Example 84. (warmup)

(a) If $x \equiv 3 \pmod{10}$, what can we say about $x \pmod{5}$?

(b) If $x \equiv 3 \pmod{7}$, what can we say about $x \pmod{5}$?

Solution.

(a) If $x \equiv 3 \pmod{10}$, then $x \equiv 3 \pmod{5}$.
[Why?! Because $x \equiv 3 \pmod{10}$ if and only if $x = 3 + 10m$, which modulo 5 reduces to $x \equiv 3 \pmod{5}$.]

(b) Absolutely nothing! $x = 3 + 7m$ can be anything modulo 5 (because $7 \equiv 2$ is invertible modulo 5).

Example 85. If $x \equiv 32 \pmod{35}$, then $x \equiv 2 \pmod{5}$, $x \equiv 4 \pmod{7}$.

Why?! As in the first part of the warmup, if $x \equiv 32 \pmod{35}$, then $x \equiv 32 \pmod{5}$ and $x \equiv 32 \pmod{7}$.

The Chinese remainder theorem says that this can be reversed!

That is, if $x \equiv 2 \pmod{5}$ and $x \equiv 4 \pmod{7}$, then the value of x modulo $5 \cdot 7 = 35$ is determined.
[How to find the exact $x \equiv 32 \pmod{35}$ is discussed in the next example.]

Example 86. Solve $x \equiv 2 \pmod{5}$, $x \equiv 4 \pmod{7}$.

Solution. $x \equiv 2 \cdot 7 \cdot \underbrace{7^{-1}_{\text{mod } 5}}_{3} + 4 \cdot 5 \cdot \underbrace{5^{-1}_{\text{mod } 7}}_{3} \equiv 42 + 60 \equiv 32 \pmod{35}$

Important comment. Can you see how we need 5 and 7 to be coprime here?

Brute force solution. Note that, while in principle we can always perform a brute force search, this is not practical for larger problems. Here, if x is a solution, then so is $x + 35$. So we only look for solutions modulo 35.
Since $x \equiv 4 \pmod{7}$, the only candidates for solutions are $4, 11, 18, \ldots$ Among these, we find $x = 32$.
[We can also focus on $x \equiv 2 \pmod{5}$ and consider the candidates $2, 7, 12, \ldots$, but that is even more work.]

Theorem 87. (Chinese Remainder Theorem) Let $n_1, n_2, \ldots, n_r$ be positive integers with $\gcd(n_i, n_j) = 1$ for $i \neq j$. Then the system of congruences

$$x \equiv a_1 \pmod{n_1}, \quad \ldots, \quad x \equiv a_n \pmod{n_r}$$

has a simultaneous solution, which is unique modulo $n = n_1 \cdots n_r$.

In other words. The Chinese remainder theorem provides a bijective (i.e., 1-1 and onto) correspondence

$$x \pmod{nm} \mapsto \begin{bmatrix} x \pmod{n} \\ x \pmod{m} \end{bmatrix}.$$

For instance. Let's make the correspondence explicit for $n = 2$, $m = 3$:
$0 \mapsto \begin{bmatrix} 0 \\ 0 \end{bmatrix}$, $1 \mapsto \begin{bmatrix} 1 \\ 1 \end{bmatrix}$, $2 \mapsto \begin{bmatrix} 0 \\ 2 \end{bmatrix}$, $3 \mapsto \begin{bmatrix} 1 \\ 0 \end{bmatrix}$, $4 \mapsto \begin{bmatrix} 0 \\ 1 \end{bmatrix}$, $5 \mapsto \begin{bmatrix} 1 \\ 2 \end{bmatrix}$

Example 88. Here's a graphical representation for $n=3$, $m=5$. Do you see the pattern?

(mod 3) \ (mod 5)	0	1	2	3	4
0	0	6		3	
1		1	$\ddots$		4
2	5		2	$\ddots$	

$\rightsquigarrow$

(mod 3) \ (mod 5)	0	1	2	3	4
0	0	6	12	3	9
1	10	1	7	13	4
2	5	11	2	8	14

Example 89. Solve $x\equiv 1 \pmod{4}$, $x\equiv 2 \pmod{5}$, $x\equiv 3 \pmod{7}$.

Solution. $x\equiv 1\cdot 5\cdot 7\cdot \underbrace{[(5\cdot 7)^{-1}_{\text{mod } 4}]}_{3} + 2\cdot 4\cdot 7\cdot \underbrace{[(4\cdot 7)^{-1}_{\text{mod } 5}]}_{2} + 3\cdot 4\cdot 5\cdot \underbrace{[(4\cdot 5)^{-1}_{\text{mod } 7}]}_{-1}$
$\equiv 105+112-60=157\equiv 17 \pmod{140}$.

Silicon slave labor. Once you are comfortable doing it by hand, you can easily let Sage do the work for you:

```
Sage] crt([1,2,3], [4,5,7])

   17
```

Example 90. Solve $x\equiv 2 \pmod{3}$, $3x\equiv 2 \pmod{5}$, $5x\equiv 2 \pmod{7}$.

Solution. Note that $3^{-1}\equiv 2 \pmod{5}$ and $5^{-1}\equiv 3 \pmod{7}$.
Hence, we can simplify the congruences to $x\equiv 2 \pmod{3}$, $x\equiv 2\cdot 2\equiv -1 \pmod{5}$, $x\equiv 2\cdot 3\equiv -1 \pmod{7}$.
Using the CRT, $x\equiv 2\cdot 5\cdot 7\cdot \underbrace{[(5\cdot 7)^{-1}_{\text{mod } 3}]}_{2} - 1\cdot 3\cdot 7\cdot \underbrace{[(3\cdot 7)^{-1}_{\text{mod } 5}]}_{1} - 1\cdot 3\cdot 5\cdot \underbrace{[(3\cdot 5)^{-1}_{\text{mod } 7}]}_{1}$
$\equiv 140-21-15=104\equiv -1 \pmod{105}$.

Example 91. (extra)

(a) Solve $x\equiv 2 \pmod{4}$, $x\equiv 3 \pmod{25}$.

(b) Solve $x\equiv -1 \pmod{4}$, $x\equiv 2 \pmod{7}$, $x\equiv 0 \pmod{9}$.

Solution. (final answer only)

(a) $x\equiv 78 \pmod{100}$

(b) $x\equiv 135 \pmod{252}$

Example 92.

(a) Let $p>3$ be a prime. Show that $x^2\equiv 9 \pmod{p}$ has exactly two solutions (i.e. ± 3).

(b) Let p, $q>3$ be distinct primes. Show that $x^2\equiv 9 \pmod{pq}$ always has exactly four solutions (± 3 and two more solutions $\pm a$).

Solution.

(a) If $x^2\equiv 9 \pmod{p}$, then $0\equiv x^2-9=(x-3)(x+3) \pmod{p}$. Since p is a prime it follows that $x-3\equiv 0 \pmod{p}$ or $x+3\equiv 0 \pmod{p}$. That is, $x\equiv \pm 3 \pmod{p}$.

(b) By the CRT, we have $x^2\equiv 9 \pmod{pq}$ if and only if $x^2\equiv 9 \pmod{p}$ and $x^2\equiv 9 \pmod{q}$. Hence, $x\equiv \pm 3 \pmod{p}$ and $x\equiv \pm 3 \pmod{q}$. These combine in four different ways.
For instance, $x\equiv 3 \pmod{p}$ and $x\equiv 3 \pmod{q}$ combine to $x\equiv 3 \pmod{pq}$. However, $x\equiv 3 \pmod{p}$ and $x\equiv -3 \pmod{q}$ combine to something modulo pq which is different from 3 or -3.

Why primes >3? Why did we exclude the primes 2 and 3 in this discussion?
Comment. There is nothing special about 9. The same is true for $x^2\equiv a^2 \pmod{pq}$ for any integer a.
