

**Example 76. (review)** The solutions to  $x^2 \equiv 9 \pmod{35}$  are  $\pm 3$  and  $\pm 17 \pmod{35}$ .

**Example 77.** Determine all solutions to  $x^2 \equiv 4 \pmod{105}$ .

**Solution.** By the CRT:

$$\begin{aligned} x^2 &\equiv 4 \pmod{105} \\ \iff x^2 &\equiv 4 \pmod{3} \text{ and } x^2 \equiv 4 \pmod{5} \text{ and } x^2 \equiv 4 \pmod{7} \\ \iff x &\equiv \pm 2 \pmod{3} \text{ and } x \equiv \pm 2 \pmod{5} \text{ and } x \equiv \pm 2 \pmod{7} \end{aligned}$$

At this point, we see that there are  $2^3 = 8$  solutions.

For instance, let us find the solution corresponding to  $x \equiv 2 \pmod{3}$ ,  $x \equiv 2 \pmod{5}$ ,  $x \equiv -2 \pmod{7}$ :

$$x \equiv 2 \cdot 5 \cdot 7 \cdot \underbrace{[(5 \cdot 7)_{\text{mod } 3}^{-1}]_{-1}} + 2 \cdot 3 \cdot 7 \cdot \underbrace{[(3 \cdot 7)_{\text{mod } 5}^{-1}]_1} - 2 \cdot 3 \cdot 5 \cdot \underbrace{[(3 \cdot 5)_{\text{mod } 7}^{-1}]_1} \equiv -70 + 42 - 30 = -58 \equiv 47$$

Similarly, we find all eight solutions (note how the solutions pair up):

(mod 3)	(mod 5)	(mod 7)	(mod 105)
2	2	2	2
-2	-2	-2	-2
2	2	-2	47
-2	-2	2	-47
2	-2	2	23
-2	2	-2	-23
-2	2	2	37
2	-2	-2	-37

The complete list of solutions is:  $\pm 2, \pm 23, \pm 37, \pm 47$

**Silicon slave labor.** Once we are comfortable doing it by hand, we can easily let Sage do the work for us:

```
Sage] crt([2,2,-2], [3,5,7])
```

47

```
Sage] solve_mod(x^2 == 4, 105)
```

[(37), (82), (58), (103), (2), (47), (23), (68)]

**Review: quadratic residues**

**Definition 78.** An integer  $a$  is a **quadratic residue** modulo  $n$  if  $a \equiv x^2 \pmod{n}$  for some  $x$ .

**Important note.** Products of quadratic residues are quadratic residues.

**Example 79.** List all quadratic residues modulo 11.

**Solution.** We compute all squares:  $0^2 = 0$ ,  $(\pm 1)^2 = 1$ ,  $(\pm 2)^2 = 4$ ,  $(\pm 3)^2 = 9$ ,  $(\pm 4)^2 \equiv 5$ ,  $(\pm 5)^2 \equiv 3$ . Hence, the quadratic residues modulo 11 are 0, 1, 3, 4, 5, 9.

**Important comment.** Exactly half of the 10 nonzero residues are quadratic. Can you explain why?

[Hint.  $x^2 \equiv y^2 \pmod{p} \iff (x - y)(x + y) \equiv 0 \pmod{p} \iff x \equiv y \text{ or } x \equiv -y \pmod{p}$ ]

**Example 80.** List all quadratic residues modulo 15.

**Solution.** We compute all squares modulo 15:  $0^2 = 0$ ,  $(\pm 1)^2 = 1$ ,  $(\pm 2)^2 = 4$ ,  $(\pm 3)^2 = 9$ ,  $(\pm 4)^2 \equiv 1$ ,  $(\pm 5)^2 \equiv 10$ ,  $(\pm 6)^2 \equiv 6$ ,  $(\pm 7)^2 \equiv 4$ . Hence, the quadratic residues modulo 15 are 0, 1, 4, 6, 9, 10.

**Important comment.** Among the  $\phi(15) = 8$  invertible residues, the quadratic ones are 1, 4 (exactly a quarter). Note that 15 is of the form  $n = pq$  with  $p, q$  distinct primes.

**Theorem 81.** Let  $p, q, r$  be distinct odd primes.

- The number of invertible residues modulo  $n$  is  $\phi(n)$ .
- The number of invertible quadratic residues modulo  $p$  is  $\frac{\phi(p)}{2} = \frac{p-1}{2}$ .
- The number of invertible quadratic residues modulo  $pq$  is  $\frac{\phi(pq)}{4} = \frac{p-1}{2} \frac{q-1}{2}$ .
- The number of invertible quadratic residues modulo  $pqr$  is  $\frac{\phi(pqr)}{8} = \frac{p-1}{2} \frac{q-1}{2} \frac{r-1}{2}$ .
- ...

**Proof.**

- We already knew that the number of invertible residues modulo  $n$  is  $\phi(n)$ .
- Think about squaring all residues modulo  $p$  to make a complete list of all quadratic residues. Let  $a^2$  be one of the nonzero quadratic residues. As we observed earlier,  $x^2 \equiv a^2 \pmod{p}$  has exactly 2 solutions, meaning that exactly two residues (namely  $\pm a$ ) square to  $a^2$ . Hence, the number of invertible quadratic residues modulo  $p$  is half the number of invertible residues modulo  $p$ .
- Again, think about squaring all residues modulo  $pq$  to make a complete list of all quadratic residues. Let  $a^2$  be one of the invertible quadratic residues. By the CRT,  $x^2 \equiv a^2 \pmod{pq}$  has exactly 4 solutions (why is it important that  $a$  is invertible here?!), meaning that exactly four residues square to  $a^2$ . Hence, the number of invertible quadratic residues modulo  $pq$  is a quarter of the number of invertible residues modulo  $pq$ .
- Spell out the situation modulo  $pqr$ ! □

**Comment.** Make similar statements when one of the primes is equal to 2.

**Example 82. (bonus!)** What is the total number of quadratic residues modulo  $pqr$  if  $p, q, r$  are distinct odd primes?  
(To collect a bonus point, send me the answer and a short explanation by next week.)
