## **Sketch of Lecture 15**

**Review.** If N is composite, then a residue a is a Fermat liar modulo N if  $a^{N-1} \equiv 1 \pmod{N}$ .

**Example 96.** Using Sage, determine all numbers n up to 5000, for which 2 is a Fermat liar.

Sage] def is\_fermat\_liar(x, n):
 return not is\_prime(n) and power\_mod(x, n-1, n) == 1

Sage] [ n for n in [1..5000] if is\_fermat\_liar(2, n) ]

[341, 561, 645, 1105, 1387, 1729, 1905, 2047, 2465, 2701, 2821, 3277, 4033, 4369, 4371, 4681]

Even if you have never written any code, you can surely figure out what's going on! Heads-up! The improved primality test discussed today will reduce this list to just 2047, 3277, 4033, 4681.

## The Miller–Rabin primality test

**Review.** The congruence  $x^2 \equiv 1 \pmod{p}$  has only the solutions  $x \equiv \pm 1$ .

By contrast, if n is composite (and odd), then  $x^2 \equiv 1 \pmod{n}$  has additional solutions.

The Miller-Rabin primality test exploits this difference to fix the issues of the Fermat primality test.

The Fermat primality test picks *a* and checks whether  $a^{n-1} \equiv 1 \pmod{n}$ .

- If  $a^{n-1} \not\equiv 1 \pmod{n}$ , then we are done because n is definitely not a prime.
- If a<sup>n-1</sup>≡1 (mod n), then either n is prime or a is a Fermat liar. But instead of leaving off here, we can dig a little deeper: Note that a<sup>(n-1)/2</sup> satisfies x<sup>2</sup>≡1 (mod n). If n is prime, then x≡±1 so that a<sup>(n-1)/2</sup>≡±1 (mod n).
  - Hence, if  $a^{(n-1)/2} \not\equiv \pm 1 \pmod{n}$ , then we again know for sure that n is not a prime. Advanced comment. In fact, we can now factor n! See bonus challenge below.
  - If  $a^{(n-1)/2} \equiv 1 \pmod{n}$  and  $\frac{n-1}{2}$  is divisible by 2, we continue and look at  $a^{(n-1)/4} \pmod{n}$ .
    - If  $a^{(n-1)/4} \not\equiv \pm 1 \pmod{n}$ , then n is not a prime.

- If 
$$a^{(n-1)/4} \equiv 1 \pmod{n}$$
 and  $\frac{n-1}{4}$  is divisible by 2, we continue...

Write  $n-1=2^s\cdot m$  with m odd. In conclusion, if n is a prime, then

$$a^m \equiv 1$$
 or, for some  $r = 0, 1, ..., s - 1, a^{2^r m} \equiv -1 \pmod{n}$ .

In other words, if n is a prime, then the values  $a^m, a^{2m}, ..., a^{2^sm}$  must be of the form 1, 1, ..., 1 or ..., -1, 1, 1, ..., 1. If the values are of this form even though n is composite, then a is a strong liar modulo n.

This gives rise to the following improved primality test:

```
Miller-Rabin primality test

Input: number n and parameter k indicating the number of tests to run

Output: "not prime" or "likely prime"

Algorithm:

Write n - 1 = 2^s \cdot m with m odd.

Repeat k times:

Pick a random number a from \{2, 3, ..., n - 2\}.

If a^m \not\equiv 1 \pmod{n} and a^{2^rm} \not\equiv -1 \pmod{n} for all r = 0, 1, ..., s - 1, then

stop and output "not prime".

Output "likely prime".
```

**Comment.** If *n* is composite, then fewer than a quarter of the values for *a* can possibly be strong liars. In other words, for all composite numbers, the odds that the Miller–Rabin test returns "likely prime" are less than  $4^{-k}$ . **Comment.** Note that, though it looks more involved, the Miller–Rabin test is essentially as fast as the Fermat

primality test (recall that, to compute  $a^{n-1}$ , we proceed using binary exponentiation). Advanced comments. This is usually implemented as a probabilistic test. However, assuming GRH (the generalized Riemann hypothesis), it becomes a deterministic algorithm if we check  $a = 2, 3, ..., \lfloor 2(\log n)^2 \rfloor$ . This is mostly of interest for theoretical applications. For instance, this then becomes a polynomial time algorithm for

More recently, in 2002, the AKS primality test was devised. This test is polynomial time (without relying on outstanding conjectures like GRH).

**Example 97.** Suppose we want to determine whether n = 221 is a prime. Simulate the Miller–Rabin primality test for the choices a = 24, a = 38 and a = 47.

Solution.  $n-1=4\cdot 55=2^s\cdot m$  with s=2 and m=55.

checking whether a number is prime.

For a = 24, we compute a<sup>m</sup> = 24<sup>55</sup> ≡ 80 ≠ ±1 (mod 221). We continue with a<sup>2m</sup> ≡ 80<sup>2</sup> ≡ 212 ≠ -1, and conclude that n is not a prime.
 Note. We do not actually need to compute that a<sup>n-1</sup> = a<sup>4m</sup> ≡ 81, which features in the Fermat test

Note. We do not actually need to compute that  $a^{n-1} = a^{4m} \equiv 81$ , which features in the Fermat test and which would also lead us to conclude that n is not prime.

• For a = 38, we compute  $a^m = 38^{55} \equiv 64 \not\equiv \pm 1 \pmod{221}$ . We continue with  $a^{2m} \equiv 64^2 \equiv 118 \not\equiv -1$  and conclude that n is not a prime.

Note. This case is somewhat different from the previous in that 38 is a Fermat liar. Indeed,  $a^{4m} \equiv 118^2 \equiv 1 \pmod{221}$ . This means that we have found a nontrivial squareroot of 1. In this case, the Fermat test would have failed us while the Miller–Rabin test succeeds.

• For a = 47, we compute  $a^m = 47^{55} \equiv 174 \not\equiv \pm 1 \pmod{221}$ . We continue with  $a^{2m} \equiv 174^2 \equiv -1$ . We conclude that n is a prime or a is a strong liar. In other words, we are not sure but are (incorrectly) leaning towards thinking that 221 was likely a prime.

**Comment.** In this example, only 4 of the 218 residues 2, 3, ..., 219 are strong liars (namely 21, 47, 174, 200). For comparison, there are 14 Fermat liars (namely 18, 21, 38, 47, 64, 86, 103, 118, 135, 157, 174, 183, 200, 203).

**Example 98.** In Example 94, we saw that all  $\phi(561) = 320$  invertible residues *a* modulo 561 are Fermat liars (that is, they all satisfy  $a^{560} \equiv 1 \pmod{561}$ ). How many of them are strong liars?

**Solution.** Only 8 of the 558 residues 2, 3, ..., 559 are strong liars (namely 50, 101, 103, 256, 305, 458, 460, 511). That's about 1.43% (much less than the theoretic bound of 25%).

(bonus challenge) For which N < 1000 is the proportion of strong liars the highest?

Here (as illustrated in the case of 561 above) we define the proportion of strong liars to be the proportion of residues among 2, 3, ..., N-2, which are strong liars.

[That proportion is almost 23%, just shy of the theoretical bound of 25%.]

Send in a solution by next week for a bonus point!
